

AI-Powered Government Software Compliance

Lowering barriers. Raising the bar.

Our AI-native agentic platform and tools help government agencies and vendors achieve, maintain, and prove cybersecurity compliance for software on government networks faster than ever, clearing the path to production.

The Challenge

The government software cybersecurity compliance process is complex, opaque, and time consuming. Multiple complicated frameworks have similar requirements but need different documentation. Lengthy authorization processes and review cycles can delay software deployment by months or years. Constant updates to security controls require continuous monitoring and documentation, while external consultants are expensive and don't always make the process any faster.

Our Platform

Pretorin harnesses the power of AI to accelerate your path to production. Our AI Security Agent provides intelligent security monitoring and compliance verification for software deployments on government networks, ensuring continuous adherence to cybersecurity requirements. With AI-enhanced CI/CD pipelines, automated security compliance checks are integrated directly into your development workflow, detecting and resolving issues before deployment. We automatically generate compliant documentation for FedRAMP, DoD RMF, NIST 800-53, and CMMC frameworks with human-in-the-loop verification.

Why Pretorin

We provide simple, cross-framework security compliance to help you prepare for multiple certifications without duplicating work. We provide AI support for FedRAMP, DoD RMF, NIST 800-53, and CMMC frameworks, and map controls across them so you don't waste time providing the same information multiple times. We're purpose-built for government networks and understand the reviewers, processes, and constraints that shape your path to approval. Pretorin is truly AI-led—software that does the work, not a services package with an AI gloss. We run checks in your PRs and pipelines, draft the hard documents, and organize evidence as you work. Our platform is responsive, not static, updating as your systems and the frameworks change, catching drift early and keeping outputs current so you can confidently maintain compliance.

Our Services

In addition to our AI compliance platform and tools, we build custom solutions and provide strategic guidance. We build secure, compliant, and cutting-edge software solutions tailored to your organization's unique needs, handling the entire development lifecycle while ensuring compliance with security and regulatory requirements. We provide technology consulting to help you navigate complex technology landscapes with expert guidance on technology adoption, architecture, and implementation. Our strategy and digital modernization services help you transform your organization's technology landscape with comprehensive roadmaps that balance quick wins with long-term transformation goals.

Our Mission

Improve the quality of government software. Pretorin is dedicated to creating government technology at the cutting edge of R&D and enabling others to do the same. We take a two-pronged approach: we build custom software for government agencies that need cutting-edge solutions, and we create tools that help others navigate the compliance landscape.
